No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                 A novel multimeric hybrid gene is used as a vaccine. The gene consists of two gene sequences which are linked and encode antigenic regions, these two sequences being derived from two different pathogens (parainfluenza virus (PIV) and respiratory syncitial virus (RSV)). The gene sequences that are particularly used are those which encode PIV-3 F and HN proteins (AAQ45684) and RSV F and (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The respiratory syncytial virus (RSV) G protein can be used in vaccines by inserting the G protein gene into a non-replicating vector. The G protein is placed under the control of alternative signal and expression sequences, for example the chimeric G protein produced may also comprise the signal peptide of tissue plasminogen activator (tPA). The recombinant vector may also comprise sequences upstream of the G protein gene which enhance the G protein generate antibodies directed against the RSV G protein will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunogenic composition for generating antibodies against respiratory syncytial virus - comprises non-replicating vector containing the protein g sequence, useful in protective vaccines and to raise antibodies for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein; respiratory syncytial virus; RSV; recombinant vector;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Membrane bound G protein gene of respiratory syncytial virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        vaccine; immune response; immunogenicity; tPA; antibody tissue plasminogen activator; ss.

                                                                                                                              Production of human respiratory syncytial virus glyco-protein F or ( - by culturing eukaryotic host cells transfected with corresponding {\sf DNA}_{\sf N}
                                                                                                                                                                                           The present sequence was used in the development of a novel method for the production of human respiratory syncytial virus (HRSV) glycoprotein F (gpF) or glycoprotein G (gpG). The method comprises culturing eukaryotic host cells transfected with an isolated DNA sequence encoding HRSV gpF or gpG. The gp can be used to prepare vaccines against HRSV.

                                                The sequences of mRNA encoding HRSV structural proteins are given in AAQ29622-26. The proteins are F, G, 22K, 9.5K and major capsid protein N. The sequences and encoded proteins are useful for preparing vaccines against HRSV. The vaccines can be used to confer immunity against respiratory tract infections on human subjects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence was used in the preparation of a novel polynuclectide, comprising an antisense oligonuclectide, with a hydroxy group at one end, that is complementary to 15-20 bases of the anti-genomic RNA strand of a respiratory syncytial virus (RSV), a linker attached to the OH-end of the antisense oligonuclectide and an oligonuclectide activator of RNaseL attached to the linker. The polynuclectide can be used to treat RSV infections, which can also be treated by administration of the antisense oligonuclectide, so as to form a complex with activated RNase L in vivo. The polynuclectide can be transported across the cell membranes without carriers or permeability agents, and once introduced destroys antisense target RNA. It also inhibits RSV infection in vitro in a superior manner to the conventional drug, ribavirin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps

The genome is negative-sense; the complete nucleotide sequence of the wild-type B-1 virus has also been determined (see AAV17552). A novel infectious recombinant RSV comprises a RSV genome or antigenome, a major nucleocapsid (N) protein, a nucleocapsid phosphoprotein (P), a large polymerase protein (L), and a RNA polymerase elongation factor, where the recombinant RSV has at least two attenuating mutations, one of the mutations specifying temperature-sensitive (ts) substitution at amino acid Phe521,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the 5'-3' positive sequence nucleotide sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      88

                                                                                                                                                                                      Infectious respiratory syncytial virus particles - useful for treatment of RSV or gene therapy of upper respiratory tract diseases
                                                                                                                                                                                                                                                                      A human respiratory syncytial virus (RSV) anti-genome sequence (AAT63430) is the 5' to 3' positive-sense sequence of RSV; the genomitself is negative-sense. It was synthesised in segments by RT-PCR using intracellular RSV mRNA or genomic rRNA isolated from purified viruses as template. Restriction site markers were intoduced by incorporating the changes into the primers used for RT-PCR. The recombinant sequence can be expressed with a nucleocapsid protein, a large polymerase protein and an an uncleocapsid phosphoprotein, a large polymerase protein and an RNA elongation factor to produce isolated infectious RSV particles useful for generating vaccines against RSV. Recombinant RSV genome or antigenome can also be used as a vector for gene therapy of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DB 18; Length 15223;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               720
Gln831, Met1169 or Tyr1321 in the RSV polymerase gene or a ts nucleotide substitution in the gene-start sequence of gene M2.
Also claimed are: (1) an isolated infectious RSV particle which comprises a recombinant RSV (anti) genome, N. P. and L proteins, a RNA polymerase elongation factor, where the (anti) genome is modified: (1) to ablate or modulate expression of a SH, NS1. NS2 or G gene or a cis-acting regulatory sequence; and (11) by a termination codon introduced within a selected gene, or by a change in sequence, position or presence of a GS or GB transcription signal relative to the selected gene; (2) an expression vector; and (3) an RSV strain selected from cpts RSV 248 (ArCC WR 2450), cpts 248/955 (ArCC WR 2450), cpts 248/955 (ArCC WR 2451), cpts 8XV 530 (ArCC WR 2452), cpts 530/1009 (ArCC WR 2451) or Cpts 530/1009 (ArCC WR 2452), cpts RSV 530 (ArCC WR 2455), or cpts 530/1009 (ArCC WR 2451) or B-1 cp-23 (ArCC WR 2455), or cpts 530/1009 (ArCC WR 2451) or B-1 cp-23 (ArCC WR 2455), or cpts 530/1009 (ArCC WR 2451) or B-1 cp-23 (ArCC WR 2455), or cpts 530/1009 (ArCC WR 2451) or B-1 cp-23 (ArCC WR 2455), or cpts 530/1009 (ArCC WR 2451) or B-1 cp-23 (ArCC WR 2455), or cpts 530/1009 (ArCC WR 2452) or B-1 cp-23 (ArCC WR 2455), or cpts 530/1009 (ArCC WR 2452), or cpts 530/1009 (ArCC WR 2452) or B-1 cp-23 (ArCC WR 2455), or cpts 530/1009 (ArCC WR 2450), or cpts 530/1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              540

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AATCAGCTTCTCCAATCTGTCTGAAATTACATCACAAACCACCACCATACTAGCTTCAAC 360
                                                                                                                      sequence of human respiratory syncytial virus (RSV); the genome itself is negative-sense. This antigenome CDNA, termed D46, was synthesized in segments by RT-PCR using synthetic oligonucleotides as primers and intracellular RSV mRNA or genome RNA isolated from purified virions as template. The antigenome includes a S'-terminal noriviral Gtriplet contributed by the T7 promoter, 4 sequence markers (see AAA88745-47) at positions 1099 (which adds 1 nucleotide to the length), 1139, 5611 and 7559, a ribozyme and tandem T7 terminators, and a single norviral 3'-phosphorylated residue contributed to the 3' end by ribozyme cleavage. The invention provides an isolated infectious chimeric RSV comprising a major nucleocapsid (N) protein, a nucleocapsid phosphoprotein (P), a nucleocapsid phosphoprotein (P), and a partial or complete RSV genome or antigenome of one RSV strain or subgroup virus. The chimeric RSV is a chifferent RSV strain or subgroup virus combined with a heterologous gene of a chifferent RSV strain or subgroup virus. The chimeric RSV is a chifferent such as pneumonia and bronchiolitis in infantes. The mutations. It is useful as a vaccine against RSV, which causes diseases such as pneumonia and bronchiolitis in infantes. The almune system of an individual is stimulated to induce procection against natural RSV infection, preferably in a multivalent manner to achieve protection against multiple RSV strains and/or subgroups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

The construct can be used to immunize animals and humans against respiratory syncytial virus. The use of transgenic plants to generate the antigen allows the production of greater amounts of

The invention relates to a recombinant Sendai virus comprising an exogenous nucleic acid encoding a paramyxovirus (PMV) protein or its antigenic fragment. The virus may be administered in combination with an antiviral chemotherapeutic compound. Two or more viruses expressing different PMV proteins nay be co-administered. Compositions comprising the virus are useful for eliciting a humoral and/or comprising the virus are useful for eliciting a humoral and/or purther a recombinant Sendai virus comprising an exogenous nucleic acid encoding a second PMV protein is also administered and priming and/or consting humoral or cellular immune response comprises administering one or more of a recombinant or isolated PMV protein or its antigenic fragment, a DNA vaccine encoding the same, and a non-Sendai viral one or more of a recombinant or isolated PMV protein or its antigenic fragment, a DNA vaccine encoding the same, and a non-Sendai viral effective vaccine against hprv or RSV (the major causes of paediatric respiratory disease) and also to express any gene of interest in target cells, providing a positive medical impact on impaired cells. Mild-type globin gene transfer (i.e. gene therapy) into stem cells effects a cure for sickle cell disease or betathate sendai virus replicates at level that is high enough to impair decidin immunity, but does not cause any harm to human recipient. The present sequence encodes a respiratory syncytial virus (RSV) G procein (sequence encodes a respiratory syncytial virus fRSV) G procein (sequence encodes a respiratory syncytial virus fRSV) G procein (sequence encodes a respiratory syncytial virus fRSV) G procein (sequence encombinant virus of the invention.

The specification describes a composition comprising a polynucleotide consisting of an antisense oligonucleotide containing a hydroxy group, complementary to the genomic or antisenomic strand of a negative-strand RNA wirus, and an activator of RNSse L. The polynucleotide is used to inhibit, or treat, infection by negative-strand RNA viruses, specifically respiratory syncytial virus (RSV) but also (para)influenza, mumps, and rables. The polynucleotide can cross cell membranes without requiring carriers or permeabilizing agents, and can selectively cleave the RNA targeted by the oligonucleotide. The present sequence represents
                                                                                                                                                                                                                                                                                                          New composition useful for inhibiting or treating infections against negative-strand RNA virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 15210 BP; 4232 A; 2351 C; 2700 G; 5919 T; 8 other;

produced may also comprise the signal peptide of tissue plasminogen activator (LPA). The recombinant vector may also comprise the signal peptide of tissue plasminogen activator (LPA). The recombinant vector may also comprise sequences immunoprotective ability. The resulting immunogenic composition will agenerate antibodies directed against the RSV G protein when administered to a host organism. The composition is useful as a vaccine to immunise against RSV-associated disease, particularly by usual immunisation and cell fusion methods.
                                 The respiratory syncytial virus (RSV) G protein can be used in vaccines by inserting the G protein gene into a non-replicating vector. The G protein is placed under the control of alternative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Such that when an in-frame fusion is made, the resultant fusion protein may be transported to, and anchored in, a mammalian cell membrane where it can be exposed to the host immune system.

Insertion of pneumococcal surface protein A (PspA) coding sequence created plasmid pKSD2601. Intramuscular immunisation of BALB/c created plasmid pKSD2601 induced protection against an otherwise lethal challenge with a capsular type 3 pneumococcus. A claimed plasmid for expression of pneumococcal epitope DNA in eukaryotic cells includes a promoter for driving expression in a eukaryotic cell ceg. HVM-IR). DNA encoding a leader sequence (e.g. of RSVG) and DNA encoding a pneumonoccal epitope such as PspA. The invention also provides a vaccine comprising the plasmid and a suitable carrier or diluent, and optionally one or more cytokines or DNA encoding them, or a bacterial delivery system. The vaccine is used to elicit an immunological response in a host, including humans, susceptible to pneumococcal infection or sepsis. The plasmid can also be used to express a pneumococcal epitope of interest in vitro.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  67

ò

This is the complete nucleotide sequence of the wild-type B-1 respiratory syncytial virus (RSV). The genome is negative-sense the 5'-3' positive-sense sequence of D46 is provided in AAV17553.

A novel infectious recombinant RSV comprises a RSV genome or antigenome, a major nucleocappia (N) protein, a nucleocapsid phosphoprotein (P), a large polymerase protein (L), and a RNA polymerase elongation factor, where the recombinant RSV has at polymerase elongation factor, where the recombinant RSV has at camperature-sensitive (ts) substitution at amino acid Phe521, a last temperature-sensitive (ts) substitution at amino acid Phe521, and class two attenuating mutations, one of the mutations specifying a temperature-sensitive (ts) substitution at amino acid Phe521, and claimed are: (1) an isolated infectious RSV particle which comprises a recombinant RSV (anti)genome, N, P, and I proteins, a RNA polymerase elongation factor, where the (anti)genome is modified: (1) to ablate or modulate expression of a SH, NSI, NS2 or G gene or a cis-acting regulatory sequence, or by a change in sequence, introduced within a selected gene, or by a change in sequence, the selected gene; (2) an expression vector; and (3) an RSV strain selected gene; (2) an expression vector; and (3) an RSV strain selected gene; (2) an expression vector; and (3) an RSV strain selected gene; (2) an expression vector; and (3) an RSV strain selected gene; (2) an expression vector; and (3) an RSV strain selected from cpte RSV 248 (ATCC WR 2453), cpts RSV 530 (ATCC WR 2452), cpts 530/1009 (ATCC WR 2451) or cpts 530/1030 (ATCC WR 2452), cpts 530/1009 (ATCC WR 2451) or cpts 530/1030 (ATCC WR 2452), cpts 530/1009 (ATCC WR 2453), cpts RSV 540 and RSV particles are used in a vaccine or communiant RSV and RSV particles are used in a vaccine protection and against MSV the expenses on vector of inforce protection or simulate the immune system of an individual to induce procedure. Sequence 15225 BP; 5904 A; 2710 C; 2399 G; 4212 T; 0 other; protection against RSV. The expression vector of (2) the production of infectious attenuated RSV particles. Example 4; Page 195-202; 238pp; English.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Respiratory syncytial virus is a negative-strand RNA pleomorphic enveloped virus of the genus Pneumovirus. The matrix protein has no homology with the matrix proteins of other negative-stranded RNA viruses, implying that RS virus has undergone extensive evolutionary divergence. Two unidentified reading frames which potentially encode proteins were located: one overlaps the matrix protein and the other the F protein. The biological significance of these two reading frames is not clear. The positive strand is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11 (bases 1 to 528; 552 to 1050)

Title: Perfect score: Sequence:

US-09-462-816-2 1544 1 MSKNKDQRTAKTLEKTWDTL.....VSTTSRHPSQPSSPPNTTRQ 298

Scoring table:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Total number of hits satisfying chosen parameters:

127863 seqs, 47026705 residues

Searched:

Minimum DB seq length: 0 Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt_41:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Identification of variable domains of the attachment (G) protein of subgroup A respiratory syncytial viruses.";
J. Gen. Virol. 72:2091-2096(1991).
-!- FUNCTION: UNLIKE THE OTHER PARAMYXOVIRUS ATTACHMENT PROTEINS, THE RESPIRATORY SYNCYTIAL VIRUS G PROTEIN LACKS BOTH NEURAMINIDASE AND HEMAGGIUTINATING ACTIVITIES.
-!- SUBCELLULAR LOCATION: EXPRESSED ON THE SURFACE OF THE INFECTED CELLS AND INCORPORATED IN THE MEMBRANE OF THE VIRIONS.
-!- FTM: MAX CARRY 40-80 SEBRARAE O-LINKED CARBOHYDRATE CHAINS DISTRIBUTED AMONG THE 91 SERINE AND THREONINE RESIDUES.
